

A functional single-cell metabolic survey identifies *Elovl1* as a target to enhance CD8⁺ T cell fitness in solid tumours

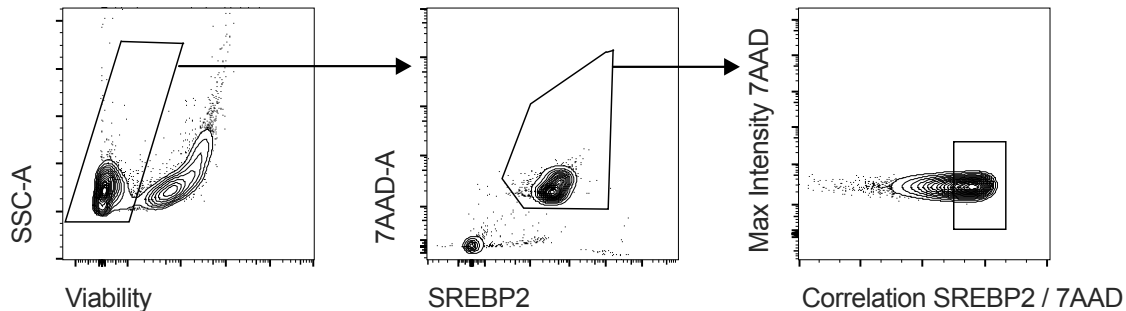

In the format provided by the
authors and unedited

Supplementary Data Figure 1

Representative gating strategy for *in vivo* OT-I T cells detection. OT-I T cells were identified using antibodies recognizing the OVA-specific alpha (TCRvα2) and beta chains (TCRvβ5.1). PD-1⁺ Tim3⁺ were gated out of OT-I T cells. T central memory (Tcm) cells were gated out of OT-I T cells as CD44⁺ CD62L⁺. Polyfunctional IFNγ⁺ TNFα⁺ cells were gated out of OT-I T cells. This gating strategy was used for generating the data of main Figure 1, 2 and 3.

Supplementary Data Figure 2

Representative gating strategy for SREBP2 nuclear translocation in *in vitro* cultured CD8⁺ T cells performed with BD FACS Discovery S8 Cell Sorter. 7AAD was used to stain the cell nucleus of CD8⁺ T cells. 7AAD⁺ SREBP2⁺ live CD8⁺ T cells were gated to include only stained cells. The ratio SREBP2/7AAD was used as a readout for SREBP2 nuclear translocation.

This gating strategy was used for generating the data of main Figure 4i.
