

A

B

A. Pie chart showing proportions of cell types after quality control. Cell types are ordered by abundance. **B.** Plot showing the average $\log_2(\text{TPM}/10)$ expression levels of marker genes in each cell type and, for each gene, the percentage of cells of each type in which that gene was detected. Points are not shown for combinations where the percentage of expressing cells is below 50%. Only non-malignant cell types with at least 10 cells are shown, and these are ordered as in A.
